

# An Event-B Specification of Library

This project tests extracting information out from a machine through parameters prefixed with out\_.

|          |                                                    |          |
|----------|----------------------------------------------------|----------|
| <b>1</b> | <b>MACHINE Library</b>                             | <b>2</b> |
| 1.1      | <i>books borrowers loans</i> . . . . .             | 2        |

VARIABLES

1.1

*books*      All books that are owned by the library.  
*borrowers*   All borrowers registered at the library.  
*loans*        All books that are loaned out.

INVARIANTS

**inv1:**    *books*  $\in \mathbb{P}(\mathbb{N})$                       We represent books  
**inv2:**    *borrowers*  $\in \mathbb{P}(\mathbb{N})$                 and borrowers using integers.  
**inv3:**    *loans*  $\in \text{books} \leftrightarrow \text{borrowers}$     A book is only loaned to one borrower at a time.

EVENT **INITIALISATION**

THEN

**init1:**    *books* :=  $\emptyset$   
**init2:**    *borrowers* :=  $\emptyset$   
**init3:**    *loans* :=  $\emptyset$

END

EVENT **addBook**

1.2

Add a new book to the library, the book must not have been added before.

ANY

*b*

WHERE

**grd1:**    *b*  $\in \mathbb{N}$   
**grd2:**    *b*  $\notin \text{books}$

THEN

**act1:**    *books* := *books*  $\cup \{b\}$

END

EVENT **addBorrower**

1.3

Add a new borrower to the library, the borrower must not have been added before.

ANY

*b*

WHERE

**grd1:**    *b*  $\in \mathbb{N}$   
**grd2:**    *b*  $\notin \text{borrowers}$

THEN

**act1:**    *borrowers* := *borrowers*  $\cup \{b\}$

END

EVENT **addLoan**

1.4

Loan a book to a borrower, the book must not be on loan already.

ANY

*borr*  
*book*

WHERE

$\text{grd1: } \text{borr} \in \text{borrowers}$       Valid borrower.  
 $\text{grd2: } \text{book} \in \text{books}$       Valid book.  
 $\text{grd3: } \text{book} \mapsto \text{borr} \notin \text{loans}$       Not a necessary test, but used for this example anyway.  
 $\text{grd4: } \text{book} \notin \text{dom}(\text{loans})$       The book is not loaned out already.

THEN

$\text{act1: } \text{loans}(\text{book}) := \text{borr}$       Add a new loan in the storage.

END

EVENT **returnBook**

1.5

Return a book, the book must be on loan.

ANY

$\text{book}$

WHERE

$\text{grd1: } \text{book} \in \text{books}$       Valid book.  
 $\text{grd2: } \text{book} \in \text{dom}(\text{loans})$       The book is on loan.

THEN

$\text{act1: } \text{loans} := \{\text{book}\} \triangleleft \text{loans}$       Remove the loan from storage.

END

EVENT **isBookOnLoan**

1.6

Check if a book is on loan.

ANY

$\text{book}$

$\text{out\_onloan}$

WHERE

$\text{grd1: } \text{book} \in \text{books}$   
 $\text{grd2: } \text{out\_onloan} = \text{bool}(\text{book} \in \text{dom}(\text{loans}))$

END

EVENT **whoBorrowsBook**

1.7

Return who is borrowing a book.

ANY

$\text{book}$

$\text{out\_borrower}$

WHERE

$\text{grd1: } \text{book} \in \text{books}$       Querying a valid book?  
 $\text{grd2: } \text{book} \in \text{dom}(\text{loans})$       That is on loan?  
 $\text{grd3: } \text{out\_borrower} = \text{loans}(\text{book})$       Return the result through out.
